## **1.0 Introduction**

At the request of the Missouri Department of Natural Resources (**MDNR**) Water Protection Program (**WPP**), the Environmental Services Program (**ESP**) Water Quality Monitoring Section (**WQMS**) conducted a biological assessment of Cedar Creek. Cedar Creek is located in the Ozark/Moreau/Loutre Ecological Drainage Unit (**EDU**), originating along the border of eastern Boone County and northwestern Callaway County. Cedar Creek is designated as a Class C stream (WBID 737) in the Missouri Water Quality Standards (MDNR 2010a) for 33 miles starting 5.3 miles southwest of Hallsville in Boone County to 0.3 miles downstream of Highway Y. The rest of Cedar Creek (WBID 733) continues 14 miles to its confluence with the Missouri River. The 33-mile Class C section of Cedar Creek is listed on the 2008 Missouri 303(d) list for impaired warm-water aquatic life from unknown pollutants. Designated uses for Cedar Creek are “warm water aquatic life protection, human health/fish consumption, livestock and wildlife watering, secondary contact recreation and class B whole body contact” (MDNR 2010a).

## **1.1 Study Area/Justification**

Seeps from approximately 1200 acres of open pit coal mines abandoned in the early 1960s historically led to frequent fish kills in a 14-mile reach of Cedar Creek. These events were associated with low pH and sulfates from the abandoned mines. Due to these problems, MDNR reclaimed this area from 1982 to 1990. However, low pH and evidence of high sulfates still occurred in areas in closer proximity to the abandoned mines. In 2001, a TMDL was completed for Cedar Creek. At the time, four miles of Cedar Creek were impaired for the beneficial use of the protection of warm water aquatic life. MDNR performed additional and intensive reclamation targeting this reach to alleviate these persistent issues, including the construction of artificial wetlands. In addition, a 2004 TMDL was completed for Cedar Creek and Manacle Creek, a tributary with a similar history that receives water from a separate mining area. This study is a post-reclamation evaluation of the biotic health of Cedar Creek.

## **1.2 Objectives**

- 1) Assess the biological (macroinvertebrate) integrity and water quality of the Cedar Creek watershed.
- 2) Determine stream habitat quality.

## **1.3 Tasks**

- 1) Conduct a biological assessment on Cedar Creek.
- 2) Conduct a stream habitat assessment at the sampling stations to ensure comparability of aquatic habitats.
- 3) Collect water samples and water quality field measurements at the bioassessment sampling stations and five tributaries of the upper Cedar Creek watershed.

#### **1.4 Null Hypotheses**

- 1) The macroinvertebrate community will not differ between longitudinally separate reaches of Cedar Creek.
- 2) The macroinvertebrate community in Cedar Creek will not differ from the riffle/pool biological criteria for the Ozark/Moreau/Loutre EDU.
- 3) The stream habitat assessment scores will not differ between longitudinally separate reaches of Cedar Creek.
- 4) The stream habitat assessment scores in Cedar Creek will not differ from the Loutre River, a riffle/pool biological criteria reference stream in the Ozark/Moreau/Loutre EDU.
- 5) Physicochemical water quality in Cedar Creek will meet the Water Quality Standards of Missouri (MDNR 2010a).
- 6) Physicochemical water quality will not differ between longitudinally separate reaches of Cedar Creek.

#### **2.0 Methods**

Mike Irwin of the Biological Assessment Unit, Water Quality Monitoring Section, Environmental Services Program, Division of Environmental Quality, Missouri Department of Natural Resources, conducted this study. All field work for the fall 2010 and spring 2011 sampling seasons was conducted by Mike Irwin and Carl Wakefield of the Biological Assessment Unit. Summer field work was conducted by Mike Irwin on July 5, 2011.

#### **2.1 Study Timing**

Macroinvertebrate and discrete water quality samples were collected at each sampling station once during the fall 2010 and spring 2011 sampling seasons. Habitat assessments for all Cedar Creek stations were completed during the fall 2010 season. Additional physicochemical samples of major tributaries were taken in fall 2010 and summer 2011.

#### **2.2 Station Descriptions**

The study area and sampling locations for the Cedar Creek bioassessment study are shown in Figure 1. A total of six Cedar Creek stations were surveyed for bioassessment sampling and water quality. Water quality samples were also collected at five tributaries of the upper Cedar Creek watershed.

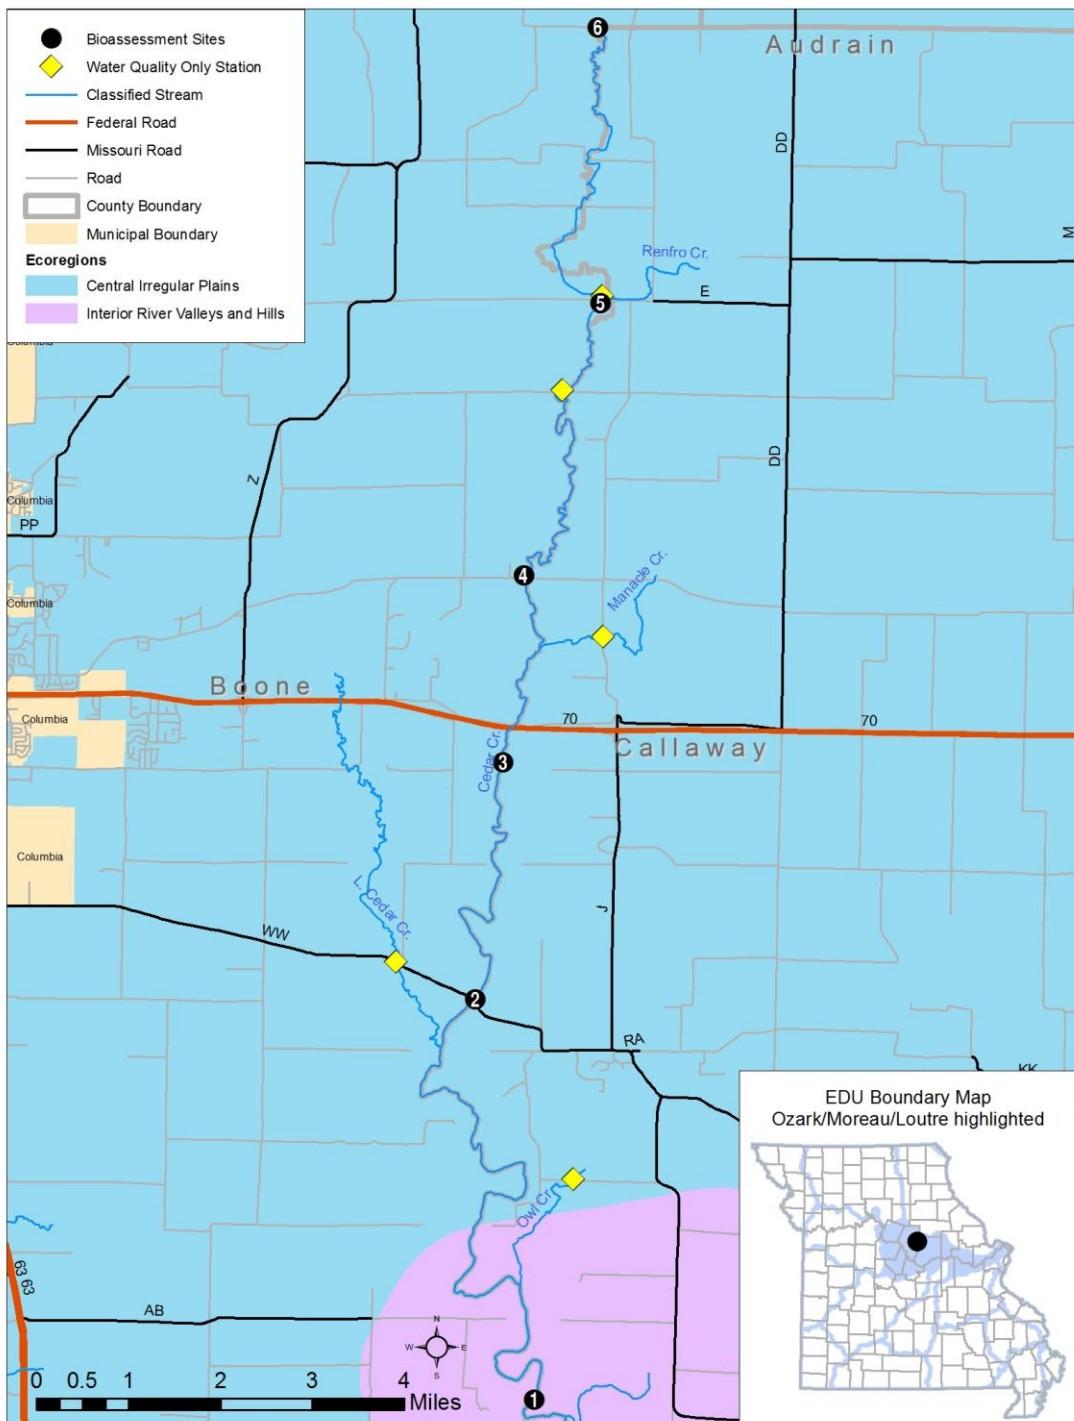

##### **2.2.1 Bioassessment Sampling Stations**

Cedar Creek #1 – Boone and Callaway counties: Legal description was NE $\frac{1}{4}$  Sec. 15, T47N, R11W. Geographic coordinates were UTM zone 15, 0573965 Easting, 4300203 Northing. Station located east of Mill Site Road in Boone County.

Cedar Creek #2 – Boone and Callaway counties: Legal description was SE $\frac{1}{4}$  NE $\frac{1}{4}$  Sec. 28, T48N, R11W. Geographic coordinates were UTM zone 15, 0573018 Easting, 4307268 Northing. Station located upstream of Boone County Highway WW/Callaway County Highway F.

Biological Assessment Report  
Cedar Creek – Boone & Callaway Counties  
September 2010 – July 2011  
Page 4

Cedar Creek #3 – Boone and Callaway counties: Legal description was SW $\frac{1}{4}$  SW $\frac{1}{4}$  Sec. 10, T48N, R11W. Geographic coordinates were UTM zone 15, 0573465 Easting, 4311311 Northing. Station located west of County Road 256 in Callaway County.

Cedar Creek #4 – Boone and Callaway counties: Legal description was SW $\frac{1}{4}$  SW $\frac{1}{4}$  Sec. 34, T49N, R11W. Geographic coordinates were UTM zone 15, 0573888 Easting, 4314695 Northing. Station located upstream of St. Charles Road in Boone County/County Road 276 in Callaway County.

Cedar Creek #5 – Boone County: Legal description was NE $\frac{1}{4}$  NE $\frac{1}{4}$  Sec. 22, T49N, R11W. Geographic coordinates were UTM zone 15, 0575219 Easting, 4319458 Northing. Station located downstream of Maupin Road in Boone County.

Cedar Creek #6 – Boone and Callaway counties: Legal description was NE $\frac{1}{4}$  NE $\frac{1}{4}$  Sec. 3, T49N, R11W. Geographic coordinates were UTM zone 15, 0575170 Easting, 4324273 Northing. Station located downstream of Remie Road in Boone County.

### **2.2.2 Additional Water Quality Sampling Stations**

Owl Creek – Callaway County: Legal description was SE $\frac{1}{4}$  NE $\frac{1}{4}$  Sec. 3, T47N, R11W. Geographic coordinates were UTM zone 15, 0574742 Easting, 4304120 Northing. Station located at Callaway County Road 342.

Little Cedar Creek – Boone County: Legal description was NE $\frac{1}{4}$  NE $\frac{1}{4}$  Sec. 29, T48N, R11W. Geographic coordinates were UTM zone 15, 0571643 Easting, 4307920 Northing. Station located at Boone County Highway WW.

Manacle Creek – Callaway County: Legal description was NW $\frac{1}{4}$  SW $\frac{1}{4}$  Sec. 2, T48N, R11W. Geographic coordinates were UTM zone 15, 0575269 Easting, 4313606 Northing. Station located at Callaway County Road 269.

Unnamed Tributary – Boone County: Legal description was SW $\frac{1}{4}$  SE $\frac{1}{4}$  Sec. 22, T49N, R11W. Geographic coordinates were UTM zone 15, 0574556 Easting, 4317916 Northing. Station located north of Callaway County Road 274.

Renfro Creek – Boone County: Legal description was SE $\frac{1}{4}$  SE $\frac{1}{4}$  Sec. 15, T49N, R11W. Geographic coordinates were UTM zone 15, 0575251 Easting, 4319573 Northing. Station located north of Maupin Road in Boone County.

### **2.3 Ecological Classification**

The Cedar Creek watershed is located in a transitional zone of two ecoregions. The upper part of the watershed is located within the Central Irregular Plains ecoregion and the lower part is located in the Interior River Valleys and Hills ecoregion. The aquatic ecological classification developed by the Missouri Resource Assessment Partnership (**MoRAP**) is a classification system that divides the aquatic resources of Missouri into

distinct regions. It has seven levels of classification starting at large regions and then dividing them into smaller sub-regions (Sowa et al. 2004). The following are the seven levels of classification in hierarchical order: zone, subzone, region, aquatic subregions, EDU, Aquatic Ecological Systems (**AES**), and Valley Segment types (**VST**). The levels of classification are based on biology, zoogeography, taxonomic composition, geology, soils, and groundwater connection. Some levels of the hierarchical system use geology and soils to classify and other levels use biology and taxonomic composition of aquatic communities. EDU and AES are the two levels of the classification system that will be assessed in detail for this study.

### 2.3.1 Ecological Drainage Unit

The EDU is level five of the classification hierarchy and is based on geographical variation of the taxonomic composition of the level four subregions. An EDU is a region in which aquatic biological communities and habitat conditions can be expected to be similar. Table 1 shows the land cover percentages from the Ozark/Moreau/Loutre EDU and the 12-digit hydrologic unit codes (**HUC**) that contain watersheds of the Cedar Creek sampling stations. Land use conditions were summarized from land cover GIS files.

Percent land cover data were derived from Thematic Mapper satellite data collected between 2000 and 2004 and interpreted by the MoRAP. Figure 2 is a map of the land cover of all three 12-digit HUCs associated with the Cedar Creek study reach. Whereas Cedar Creek station #1 had a much smaller percentage of cropland and larger percentage of forest and grassland than the Ozark/Moreau/Loutre EDU, the upstream stations had much higher percentages of cropland and lower percentages of forest land when compared to the same EDU. Little Cedar Creek was similar to upper Cedar Creek in regards to land use/land cover.

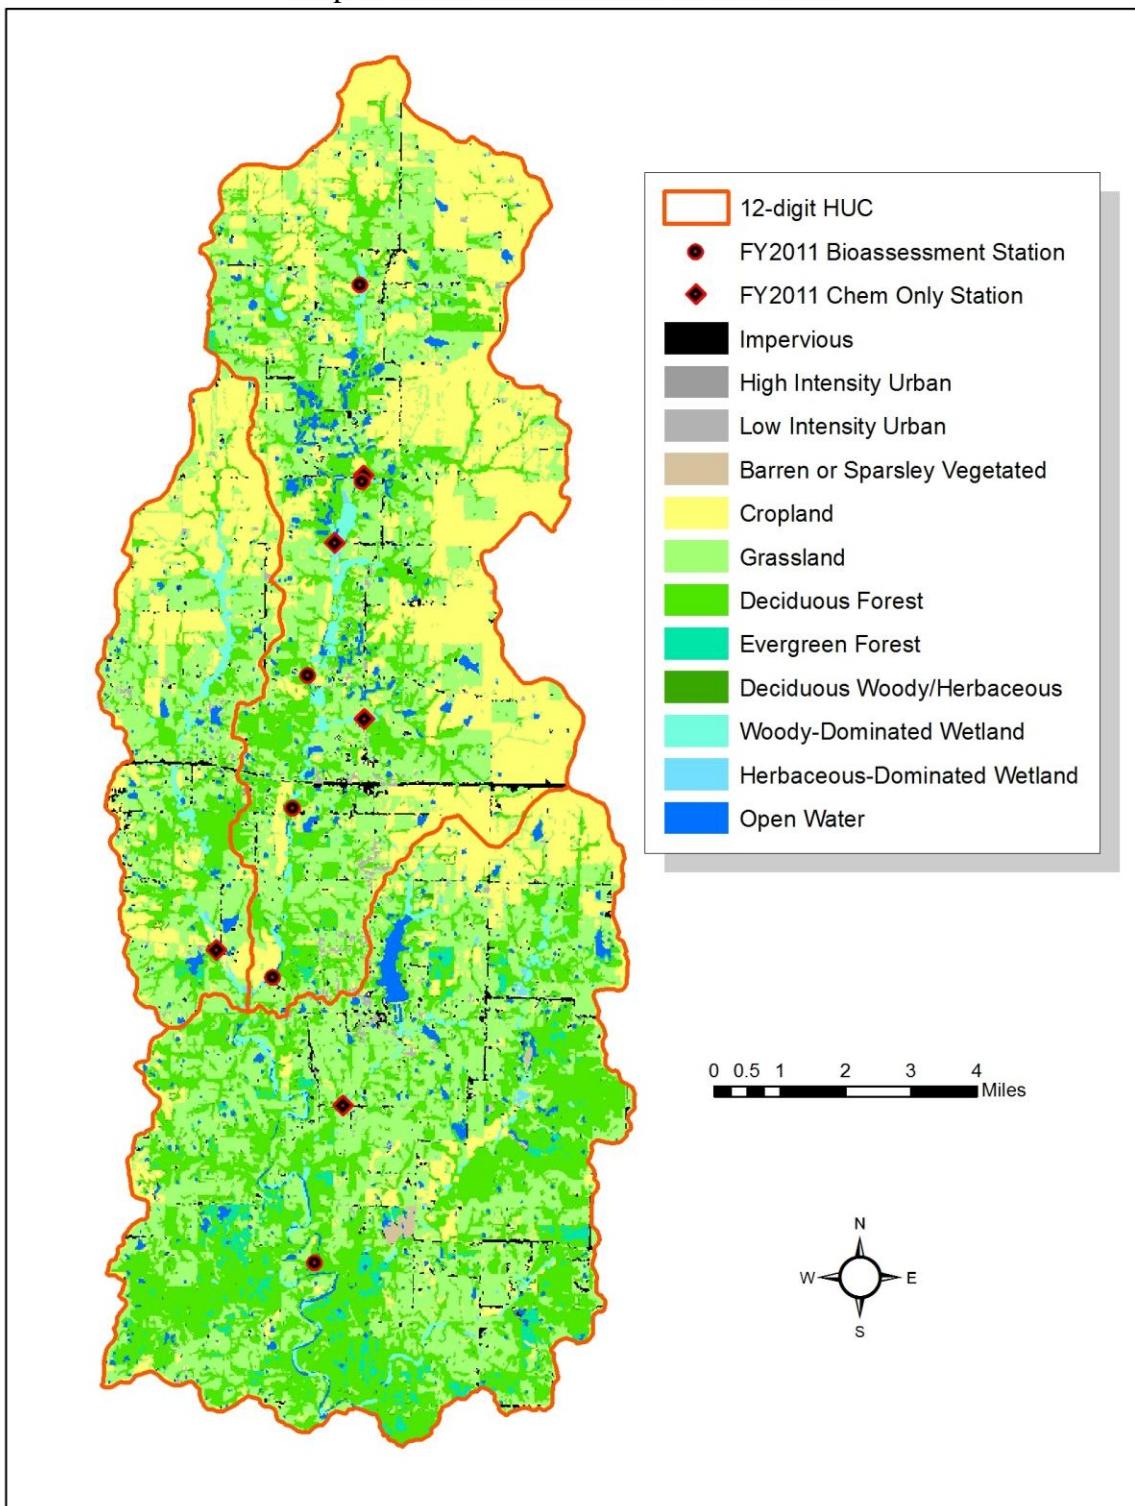

Table 1  
Percent Land Use/Land Cover

	Urban	Crops	Grassland	Forest	Wetland
Ozark/Moreau/Loutre EDU	5	20	33	34	2
Station 1 & Owl Cr (HUC12 103001021003)	2	10	41	42	2
Stations 2 - 6 & other tributaries (HUC12 103001021002)	3	38	35	20	2
Little Cedar Cr (HUC12 103001021001)	3	34	40	18	4

### 2.3.2 Aquatic Ecological Systems

Aquatic Ecological Systems (**AES**) are level six of the classification hierarchy and classify aquatic systems into types based on geology, soils, landform, and groundwater influence. Cedar Creek is located in the Moniteau Creek Aquatic Ecological Systems Type, which occurs in two clusters in Missouri (Sowa and Diamond 2006). This cluster of the Moniteau Creek AES type is made up of a variety of soils formed in deep loess with loess deposits being thickest near the Missouri River. Streams in this AES type have low gradients and carry primarily sand and gravel.

Figure 2  
Map of Cedar Creek Land Use/Land Cover

## 2.4 Stream Habitat Assessment

A standardized assessment procedure was followed as described for riffle/pool habitat in the Stream Habitat Assessment Project Procedure (**SHAPP**) (MDNR 2010b). The habitat assessment was conducted on all stations during September of 2010.

## 2.5 Biological Assessment

Biological assessments consist of macroinvertebrate collection and physicochemical sampling for two sample periods.

### 2.5.1 Macroinvertebrate Collection and Analysis

A standardized macroinvertebrate sample collection and analysis procedure was followed as described in the Semi-quantitative Macroinvertebrate Stream Bioassessment Project Procedure (**SMSBPP**) (MDNR 2010c) for riffle/pool (**RP**) streams. Samples were collected from the following standard RP habitats: coarse substrate (**CS**); depositional substrate in non-flowing water (**NF**); and root mat (**RM**).

Macroinvertebrate data were analyzed using two methods. The first analysis was calculating the Macroinvertebrate Stream Condition Index (**MSCI**) using the biological criteria for perennial/wadeable streams from the Ozark/Moreau/Loutre EDU using the four general biological metrics found in the SMSBPP (MDNR 2010c). The four general biological metrics used and found in the SMSBPP are: 1) Taxa Richness (**TR**); 2) Ephemeroptera/Plecoptera/Trichoptera Taxa (**EPTT**); 3) Biotic Index (**BI**); and 4) Shannon Diversity Index (**SDI**). The second analysis was an evaluation of macroinvertebrate community composition by percent composition of dominant macroinvertebrate groups. Comparisons of the macroinvertebrate community among the Cedar Creek stations were made.

## 2.6 Physicochemical Data Collection and Analysis

### 2.6.1 *In situ* Water Quality Measurements

During each sampling period, *in situ* water quality measurements were collected at all of the bioassessment and additional water quality sampling stations. Field measurements included water temperature (°C), dissolved oxygen (mg/L), specific conductivity (µS/cm), and pH (su).

### 2.6.2 Water Chemistry

Grab samples of stream water were collected and returned for analyses to ESP's Chemical Analysis Section. Samples from the bioassessment sampling and water quality stations were analyzed for non-filterable residue, turbidity, chloride, total phosphorus, ammonia-N, nitrate+nitrite-N, total nitrogen, total alkalinity as CaCO<sub>3</sub>, and acidity. Procedures outlined in Field Sheet and Chain of Custody Record, Standard Operating Procedure (**SOP**) MDNR-ESP-002 (MDNR 2010d), and Required/Recommended Containers, Volumes, Preservatives, Holding Times, and Special Sampling Considerations, SOP MDNR-ESP-001 (MDNR 2009), were followed when collecting

water quality samples. Stream velocity was measured at each station during the survey period using a Marsh-McBirney Flo-Mate™ Model 2000. Discharge was calculated per the methods in the SOP MDNR-ESP-113, Flow Measurement in Open Channels (MDNR 2010e).

## **2.7 Data Analysis and Quality Control**

The physicochemical data were examined by variable to identify stations that had violations of the Missouri Water Quality Standards (MDNR 2010a). Sampling stations that had values that were higher or lower than the water quality standards will be discussed with possible influences being identified.

## **3.0 Results**

### **3.1 Stream Habitat Assessment**

Habitat assessment scores for the Cedar Creek stations and the Loutre River biological reference reach (**BIOREF**) are shown in Table 2. Data were collected in September 2010 with Mike Irwin and Carl Wakefield performing the scoring. SHAPP guidance states that stations scoring at least 75 percent of the total score of reference/control stations should support a similar biological community. The stream habitat total scores indicated that all Cedar Creek stations should support a similar macroinvertebrate community compared to the Loutre River biological reference reach. Although stations #1 through #4 scored better than the Loutre River biological reference reach, stations #5 and #6 scored below 100 percent. For all Cedar Creek stations, vegetative protection was marginal or poor. Epifaunal substrate/available cover and riffle quality were poor at stations #5 and #6.

### **3.2 Macroinvertebrate Biological Assessment**

#### **3.2.1 Semi-quantitative Macroinvertebrate Stream Bioassessment Project Procedure (SMSBPP)**

Macroinvertebrate Stream Condition Index (**MSCI**) scores were calculated at the Cedar Creek stations using the riffle/pool perennial/wadeable biological criteria for the Ozark/Moreau/Loutre EDU. The MSCI scores for the fall 2010 and spring 2011 sampling seasons are shown in Table 3.

Table 2

Predominant Category Habitat Values, Category Habitat Scores, and Total Habitat Scores from Stream Habitat Assessments for the Cedar Creek Stations and the Loutre River BIOREF

<b>Stream Habitat Parameters</b>	Cedar Cr #1	Cedar Cr #2	Cedar Cr #3	Cedar Cr #4	Cedar Cr #5	Cedar Cr #6	Loutre BIOREF
SHAPP Date	9/29/2010	9/28/2010	9/28/2010	9/27/2010	9/27/2010	9/21/2010	9/30/2010
Epifaunal Substrate/Available Cover	III (10)	III (9)	II (13)	II (13)	IV (6)	IV (4)	IV (7)
Embeddedness	I (17)	I (17)	I (17)	I (18)	IV (5)	I (16)	I (17)
Velocity/Depth Regime	I (19)	III (10)	I (19)	I (18)	II (14)	II (11)	II (11)
Sediment Deposition	I (16)	II (13)	II (12)	II (13)	IV (4)	II (14)	III (8)
Channel Flow Status	II (13)	II (15)	II (12)	II (15)	II (15)	I (18)	I (16)
Channel Alteration	I (20)	I (18)	I (20)	I (19)	I (19)	I (20)	I (18)
Riffle Quality	I (16)	II (15)	II (15)	II (14)	IV (5)	IV (3)	III (7)
Bank Stability – Left Bank	I (10)	II (7)	I (9)	II (7)	III (5)	III (5)	I (10)
Bank Stability – Right Bank	I (10)	I (9)	III (4)	I (9)	I (9)	I (9)	I (10)
Vegetative Protection – Left Bank	III (5)	IV (1)	III (4)	IV (1)	IV (1)	IV (1)	IV (3)
Vegetative Protection – Right Bank	IV (2)	IV (1)	IV (1)	III (4)	IV (2)	IV (1)	IV (2)
Riparian Zone Width – Left Bank	I (10)	II (6)	I (9)	IV (2)	I (10)	I (9)	I (10)
Riparian Zone Width – Right Bank	I (10)	I (10)	I (10)	I (9)	I (9)	I (9)	I (10)
Total Habitat Score (% of BIOREF)	158 (122)	131 (102)	145 (112)	142 (110)	104 (81)	120 (93)	129 (100)

Habitat parameter categories range from I to IV with category I = optimal, category II = suboptimal, category III = marginal, and category IV = poor. Habitat parameter scores are listed in parentheses and range from 0 to 20 except for vegetative protection and riparian zone categories which range from 0 to 10.

 Page 10

Table 3  
 Fall 2010 and Spring 2011 Riffle/Pool Ozark/Moreau/Loutre EDU Perennial/Wadeable Biological Criteria, Macroinvertebrate Stream Condition Index (MSCI) Scores, and Sustainability Categories at Cedar Creek Stations

Station	TR (Score)	EPTT (Score)	BI (Score)	SDI (Score)	Total Score	Sustainability
<b>Fall 2010</b>						
Cedar Creek 1	88 (5)	16 (5)	6.7 (5)	3.32 (5)	20	Fully Biologically Supporting
Cedar Creek 2	79 (5)	<b>12 (3)</b>	<b>7.0 (3)</b>	3.24 (5)	16	Fully Biologically Supporting
Cedar Creek 3	74 (5)	<b>11 (3)</b>	<b>7.2 (3)</b>	<b>3.02 (3)</b>	14	<b>Partially Biologically Supporting</b>
Cedar Creek 4	<b>61 (3)</b>	<b>11 (3)</b>	<b>7.0 (3)</b>	<b>3.04 (3)</b>	12	<b>Partially Biologically Supporting</b>
Cedar Creek 5	<b>58 (3)</b>	<b>10 (3)</b>	<b>7.6 (3)</b>	<b>2.92 (3)</b>	12	<b>Partially Biologically Supporting</b>
Cedar Creek 6	<b>49 (3)</b>	<b>3 (1)</b>	<b>7.7 (3)</b>	<b>2.67 (3)</b>	10	<b>Partially Biologically Supporting</b>
Score of 5	>71	>13	<6.9	>3.17	--	Fully Biologically Supporting
Score of 3	35 - 71	7 - 13	8.5 - 6.9	1.59 - 3.17	--	Partially Biologically Supporting
Score of 1	<35	<7	>8.5	<1.59	--	Non-Biologically Supporting
<b>Spring 2011</b>						
Cedar Creek 1	83 (5)	<b>15 (3)</b>	<b>6.7 (3)</b>	3.23 (5)	16	Fully Biologically Supporting
Cedar Creek 2	85 (5)	<b>10 (3)</b>	<b>7.1 (3)</b>	3.30 (5)	16	Fully Biologically Supporting
Cedar Creek 3	<b>69 (3)</b>	<b>7 (3)</b>	<b>6.8 (3)</b>	3.10 (5)	14	<b>Partially Biologically Supporting</b>
Cedar Creek 4	77 (5)	<b>11 (3)</b>	<b>6.8 (3)</b>	3.35 (5)	16	Fully Biologically Supporting
Cedar Creek 5	74 (5)	<b>9 (3)</b>	<b>7.4 (3)</b>	3.29 (5)	16	Fully Biologically Supporting
Cedar Creek 6	<b>65 (3)</b>	<b>6 (1)</b>	<b>8.3 (3)</b>	<b>2.52 (3)</b>	10	<b>Partially Biologically Supporting</b>
Score of 5	>69	>15	<6.5	>2.78	--	Fully Biologically Supporting
Score of 3	35 - 69	7 - 15	8.3 - 6.5	1.39 - 2.78	--	Partially Biologically Supporting
Score of 1	<35	<7	>8.3	<1.39	--	Non-Biologically Supporting

In the fall 2010 sampling season, MSCI scores for Cedar Creek stations seemed to follow a gradient, declining in value from downstream to upstream. Station #1 received a score of 20, placing it in the fully biologically supporting category. Station #2 received an MSCI score of 16 due to lower EPTT and BI scores, but this still resulted in placement in the fully biologically supporting category. Station #3 had an MSCI score of 14 and was in the partially biologically supporting category due to low EPTT, BI, and SDI scores. Stations #4 and #5 had MSCI scores of 12 and were in the partially biologically supporting category due to low TR, EPTT, SDI, and BI scores. Station #6 had an MSCI score of 10 and was in the partially biologically supporting category due to a very low EPTT score in addition to low TR, SDI, and BI scores.

In the spring 2011 sampling season, Cedar Creek MSCI scores did not follow the same trend. Although stations #1, #2, #4, and #5 had reduced EPTT and SDI scores, all achieved MSCI scores of 16 and placement in the fully biologically supporting category. Station #3 had reduced TR, EPTT, and SDI, resulting in a score of 14 and was in the partially biologically supporting category. As was the case in fall 2010, station #6 had an

MSCI score of 10 and was in the partially biologically supporting category due to a very low EPTT score in addition to low TR, SDI, and BI scores.

### **3.2.2 Percent EPTT and Dominant Macroinvertebrate Families**

The percent of EPTT and the five dominant macroinvertebrate families at each station are presented in Table 4. Values in the tables in bold type represent the five dominant macroinvertebrate families and taxa for each station.

For fall 2010 Cedar Creek samples, station #1 had the highest percent EPTT at 59.9%, and station #4 had the next highest percent EPTT at 37.8%. Stations #6 and #3 had the lowest percent EPTT at 4.4% and 19.9%, respectively. Stations #2 and #5 had percent EPTT of 19.9% and 29.7%, respectively. This pattern was similar for spring 2011 Cedar Creek samples. Station #1 had the highest percent EPTT at 21.8%, and station #4 had the next highest percent EPTT at 18.0%. Stations #6 and #3 had the lowest percent EPTT at 1.7% and 5.9%, respectively. Stations #2 and #5 had percent EPTT of 9.8% and 10.5%, respectively.

In fall 2010 Cedar Creek samples, Chironomidae and Hydropsychidae were dominant families at all stations. Tubificidae was one of the dominant families in all stations except station #1, and Heptageniidae was one of the dominant families in all stations except station #6. Elmidae were also dominant in stations #1 through #4. Caenidae were dominant only at stations #1 and #5, and Physidae and Class Arachnoidea were dominant only at station #6. In spring 2011 Cedar Creek samples, Chironomidae and Tubificidae were dominant families at all stations. Elmidae were dominant at stations #1, #2, #3, and #5. Heptageniidae were dominant at stations #1, #2, and #4. Hydropsychidae were dominant at stations #2, #3, and #4. Simuliidae were dominant only at stations #5 and #6, and Enchytraeidae and Crangonyctidae were dominant only at station #6. Class Arachnoidea was dominant only at station #3.

Table 4  
 Percent EPT & Dominant Macroinvertebrate Families at the Cedar Creek Stations

<b>Fall 2010</b>	Cedar Cr #1	Cedar Cr #2	Cedar Cr #3	Cedar Cr #4	Cedar Cr #5	Cedar Cr #6
<b>EPTT Metrics</b>						
% EPT	59.9	24.3	19.9	37.8	29.7	4.4
% Ephemeroptera	27.2	11.7	7.8	20.7	26.3	1.7

### 3.3 Physicochemical Data

Water samples and field measurements were collected during the fall 2010 and spring 2011 macroinvertebrate sampling periods at Cedar Creek stations. Water quality samples were also taken from five tributaries within the Cedar Creek sample reach during the fall 2010 macroinvertebrate sampling period and summer 2011. Water quality sampling of the Cedar Creek tributaries was conducted in summer 2011 to reduce the effect of dilution from spring snowmelt and rains, in an effort to reflect physicochemical conditions during a low flow period. Results can be found in Table 5.

Table 5

### **3.3.1 Dissolved Oxygen**

During the fall 2010 sampling season, dissolved oxygen was above the water quality standard of 5 mg/L at all Cedar Creek stations and all four classified tributaries within the study reach. However, dissolved oxygen was only 4.02 mg/L at the unclassified and unnamed tributary located north of Callaway County Road 274. During the spring 2011 sampling season, dissolved oxygen was above the water quality standard at all Cedar Creek stations. During summer sampling of the Cedar Creek tributaries, dissolved oxygen exceeded the water quality standard at Little Cedar Creek, Owl Creek, and the unclassified and unnamed tributary located north of Callaway County Road 274. Dissolved oxygen was only slightly above the water quality standard for dissolved oxygen at Manacle Creek. Dissolved oxygen was 4.88 mg/L in Renfro Creek, but it is important to note that this water quality sample was taken during the summer just below a low-water crossing that pools water upstream for a considerable distance.

### **3.3.2 Specific Conductivity**

The only notable specific conductivity readings were found in summer 2011 samples from Manacle Creek and the unclassified and unnamed tributary located north of Callaway County Road 274. Specific conductivity was slightly elevated with a reading of 525 µS/cm at Manacle Creek and 536 µS/cm at the unnamed tributary.

### **3.3.3 Stream Discharge**

Stream discharge was very low at Cedar Creek station #6 for both seasons. Due to an equipment malfunction, stream discharge was not measured for any of the summer 2011 water quality samples. Based on visual observation, however, Manacle Creek, Little Cedar Creek, and Owl Creek appeared to have slightly elevated flow compared to conditions observed during reconnaissance the previous summer. Turbidity measures provide additional evidence of elevated discharge at these stations.

### **3.3.4 Total Nitrogen and Nitrate+Nitrite Nitrogen**

Total nitrogen and nitrate+nitrite-N were unremarkable during both seasons at all Cedar Creek stations. However, three of the classified tributaries exhibited elevated levels for total nitrogen and nitrate+nitrite-N during summer 2011 sampling. Total nitrogen levels for Little Cedar Creek, Manacle Creek, and Renfro Creek were 2.19 mg/l, 11.1 mg/L, and 4.16 mg/L, respectively.

### **3.3.5 Sulfate and Chloride**

Although none of the Cedar Creek study stations or tributaries exhibited sulfate+chloride at levels that exceeded Missouri's Water Quality Standards, many of the samples exhibited slightly elevated sulfate levels when compared to streams with no mine influence, such as the upstream Cedar Creek station #6, Little Cedar Creek, and Owl Creek. In the fall 2010 sampling season, Cedar Creek station #3 had a sulfate level of 100 mg/L. In spring 2011 samples, Cedar Creek stations #3, #4, and #5 had sulfate levels of 135 mg/L, 123 mg/L, and 152 mg/L, respectively. In summer 2011 samples of Cedar Creek tributaries, Manacle Creek and the unclassified and unnamed tributary located north of Callaway County Road 274 had sulfate concentrations of 159 mg/L and 240 mg/L, respectively.

### 3.3.6 Acidity

For the most part, acidity was unremarkable except for the unclassified and unnamed tributary located north of Callaway County Road 274 in the fall 2010 sampling season when it measured 15 mg/L.

## 4.0 Discussion

Stream habitat total scores indicated that all Cedar Creek stations should support a macroinvertebrate community similar to the Loutre River biological reference reach. According to the MSCI scores, however, this is simply not the case. Although there were differences among Cedar Creek stations in regard to MSCI scores and community structures, it should be first noted that some of the differences may be attributable to habitat and geology. For example, station #1 appears to be unique among Cedar Creek study sites. Being the most downstream station and receiving some of its discharge from the Little Cedar Creek and Owl Creek watersheds, the higher amount of discharge may be quite beneficial. Also, although all other stations are in the central irregular plains ecoregion, station #1 is in the interior river valleys and hills ecoregion. In addition, according to land use/land cover statistics, the local watershed for station #1 contains more woodlands and grasslands. By comparison, cropland is much more common in the local watershed for upstream stations.

Cedar Creek station #6 is also unique at the other end of the spectrum. This station was selected in an attempt to bracket upstream and downstream of the abandoned mine lands. Unfortunately, this action resulted in a station that is at the upstream terminus of the classified portion of the stream. It is very different than the other stations in a number of ways. Discharge was very low when compared to other Cedar Creek stations. Except for some gravel washed in from Remie Road, this station was relatively devoid of coarse substrate; therefore, it may be more representative of a headwater rather than a riffle/pool stream. An abundance of Chironomidae, Arachnoidea, Physidae, and Crangonyctidae, along with a lack of EPTT found in downstream stations, may be a demonstration of the headwater condition of this station. Although coarse substrate was still limited at station #5, discharge was substantially higher and provided additional habitat. SHAPP scores for stations #5 and #6 reflect these conditions.

Although local geology, land use/land cover, and stream discharge can have profound effects on stream biota, none of these factors alone can provide an explanation for the differences in MSCI scores and macroinvertebrate community structure in Cedar Creek, particularly in stations #2 through #5.

MSCI scores are categorized as fully biologically supporting at stations #1 and #2 for both seasons, but MSCI scores for upstream stations do not provide a clear picture of macroinvertebrate community health. The MSCI scores resulted in a designation of partially biologically supporting at Cedar Creek station #3, and it is important to note the closer proximity of Manacle Creek to this station. Cedar Creek stations #4 and #5 had MSCI scores resulting in a designation of partially biologically supporting in fall 2010, but MSCI scores resulted in a designation of fully biologically supporting in spring 2011. Note that Cedar Creek station #5 is

immediately downstream of Renfro Creek. The MSCI scores for Cedar Creek station #6 were partially biologically supporting in both seasons.

Physicochemical variables provide insight to possible Cedar Creek stressors, especially physicochemical variable measurements from Cedar Creek tributaries. During summer sampling, there was a violation of Missouri's Water Quality Standard for dissolved oxygen in Renfro Creek. Dissolved oxygen in the unclassified and unnamed tributary located north of Callaway County Road 274 was also very low; however, this was not a violation of Missouri's Water Quality Standards because the stream is unclassified. This station also had the highest acidity of all stations. In fact, this station first attracted attention during field reconnaissance in June 2010 when a strong hydrogen sulfide smell was detected. During summer water quality sampling, specific conductivity was also elevated. Sulfates were elevated in many of the samples from spring and summer 2011, but these results were at no risk of violating Missouri's sulfate+chloride combined water quality standard. Nitrate+nitrite-N and total nitrogen levels were very high in some of the Cedar Creek tributaries. Even though there are currently no Missouri water quality standards for nutrients, these elevated nutrient concentrations may be a contributor to the observed reduction in dissolved oxygen. During July sampling the total nitrogen of Manacle Creek was 11.1 mg/L, 4.16 mg/L in Renfro Creek, and 2.19 mg/L in Little Cedar Creek. According to EPA, the recommended reference condition for total nitrogen is 0.69 mg/L (U. S. EPA 2000). The reason for these elevated nitrogen values is unknown.

Aside from elevated sulfates in the Cedar Creek study reach, most of the notable results were from Cedar Creek tributaries during the summer months. Due to wet weather well into the summer, these samples were not taken at typical summer base flow conditions. At Little Cedar Creek and Owl Creek, discharge appeared to be high and specific conductivity was low. There had been isolated storms in the area the night before, and a flow meter malfunction unfortunately prevented the generation of specific stream discharge values. It is also important to note that the source of Owl Creek discharge is Little Dixie Lake, which is likely to have an effect on the physicochemical parameters of that particular stream. Studying these tributaries during typical low-flow conditions may have provided additional insight.

## 5.0 Conclusions

The first null hypothesis stated that the macroinvertebrate community will not differ between longitudinally separate reaches of Cedar Creek. The second null hypothesis stated that the macroinvertebrate community in Cedar Creek will not differ from the riffle/pool biological criteria for the Ozark/Moreau/Loutre EDU. The macroinvertebrate MSCI scores were in the partially supporting range at stations #3, #4, #5, and #6 and in the fully supporting range at the other stations during the fall 2010 sampling season. During the spring 2011 sampling season, the macroinvertebrate MSCI scores were in the partially supporting range at stations #3 and #6 and in the fully supporting range at the other stations. The MSCI results at stations #3, #4, #5, and #6 during the fall 2010 sampling season and MSCI results at stations #3 and #6 during the spring 2011 sampling season led to the rejection of the first two null hypotheses.

Biological Assessment Report  
Cedar Creek – Boone & Callaway Counties  
September 2010 – July 2011  
Page 17

The third null hypothesis stated that the stream habitat assessment scores will not differ between longitudinally separate reaches of Cedar Creek. The fourth null hypothesis stated the stream habitat assessment scores in Cedar Creek will not differ from Loutre River, a riffle/pool biological criteria reference stream in the Ozark/Moreau/Loutre EDU. The stream habitat assessment results all were above 96.75, the 75 percent value of the Loutre River biological criteria reference station habitat score of 129. This result led to the acceptance of the third and fourth null hypotheses of this study.

The fifth hypothesis stated physicochemical water quality in Cedar Creek will meet the Water Quality Standards of Missouri (MDNR 2010a). The sixth hypothesis stated physicochemical water quality will not differ between longitudinally separate reaches of Cedar Creek. Although some physicochemical parameters were outside the optimal range for many of the Cedar Creek tributaries, parameters within Cedar Creek were not shown to be problematic during this study; therefore, the fifth and sixth null hypotheses are accepted.

According to MSCI scores, Cedar Creek is partially supporting of aquatic life from an area west of County Road 256 in Callaway County to its upstream limit at Remie Road in Boone County. Sub-optimal physicochemical parameters, particularly those collected from tributaries of Cedar Creek, suggest multiple issues may be contributing to the impairment of Cedar Creek. During fall 2010 and spring 2011 sampling, sulfate and pH levels, parameters specifically associated with abandoned mine lands, were within the range of Missouri's Water Quality Standards. Future study should concentrate on characterizing physicochemical attributes of known tributaries along with the discovery and characterization of additional tributary inputs. Physicochemical parameters should be studied during low-flow periods when the concentration of tributary inputs is likely to be much higher. In addition, biological assessments of Manacle and Renfro creeks should be considered.
